

# Fertilizer and Lime Math

Hamilton County Green Express

March 2023

Robert Florence

[SoilLab.Tennessee.edu](http://SoilLab.Tennessee.edu)

# Fertilizers

[SoilLab.Tennessee.edu/fertilizer-calculator](http://SoilLab.Tennessee.edu/fertilizer-calculator)

## Lime

# Fertilizer questions to ask yourself...

What is the lawn nutrient need?

What are the percent nutrients in your fertilizer?

When to apply the fertilizer?

*Did you soil test?*

*Does the bag or bottle know your soil's exact need?*

# What is in the bag?

Label must be there by law

These are *total* amounts of nutrient

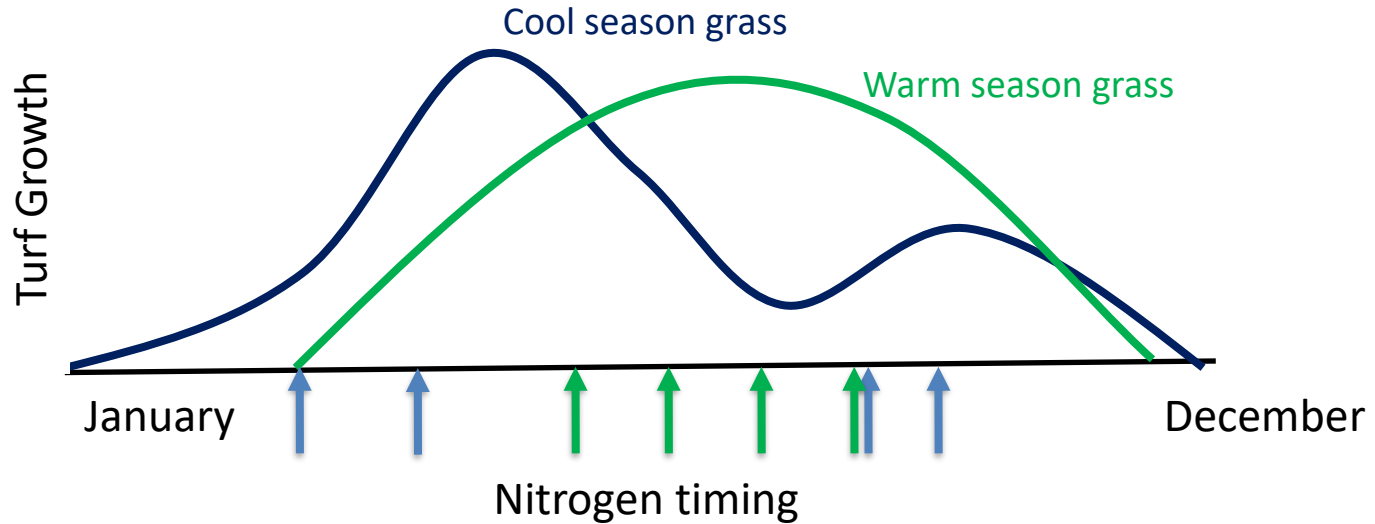

# What is the nutrient need?

## Recommendations

Crop	Fertilizer				Lime
	Nitrogen (as N)	Phosphate (as P2O5)	Potash (as K2O)	Rate	
Lawn, Cool Season	2 to 4* Split applied	1	0	pounds per 1,000 square feet	180 pounds per 1000 square feet

Please read any text below or on next sheet for additional suggestions and resources

# Nitrogen Timing

Tom Samples. 2010. Lawn Care: Selecting, Establishing & maintaining the Fescues. UT Extension Publication 1576.  
Tom samples, *et al.*, 2007. Bermudagrass Athletic Field Management Calendar. UT Extension Publication 1632.

# P and K Timing

Tom Samples. 2010. Lawn Care: Selecting, Establishing & maintaining the Fescues. UT Extension Publication 1576.  
Tom samples, *et al.*, 2007. Bermudagrass Athletic Field Management Calendar. UT Extension Publication 1632.

If we know what fertilizer we have  
and  
what our plant or lawn needs are,  
  
Then the rest is math.

# Units can trip people up...

Recommendations are made in and fertilizers sold in  
N,  $P_2O_5$ , and  $K_2O$  *equivalents*.

Try not to say “units” without context  
As in “I need 100 units of N”  
You may only get 100 pounds of product...

# Percent by weight of the nutrient *equivalents*

**N**  
Nitrogen

- **P<sub>2</sub>O<sub>5</sub>**  
Phosphorus

- **K<sub>2</sub>O**  
Potassium

**GROW FAST  
FERTILIZER**

**10-10-10**

**100 POUNDS**

100 pounds has...

10 pounds of N equivalent

10 pounds of P<sub>2</sub>O<sub>5</sub> equivalent

10 pounds of K<sub>2</sub>O equivalent

# Fertilizer formulas

To go from a recommendation to pounds of product to apply...

$$\begin{array}{l} \text{Pounds of nutrient} \\ \text{Per area} \end{array} \times \frac{100 \text{ pounds product}}{\# \text{ pounds of nutrient}} = \begin{array}{l} \text{Pounds of product} \\ \text{Per area} \end{array}$$

To go from pounds applied to how much nutrient was applied...

$$\begin{array}{l} \text{Pounds of product} \\ \text{applied per area} \end{array} \times \frac{\# \text{ pounds of nutrient}}{100 \text{ pounds of product}} = \begin{array}{l} \text{Pounds of nutrient} \\ \text{applied} \end{array}$$

# Nitrogen only need

Lawn need is,  
1 pound of N per 1,000 ft<sup>2</sup>

We have,  
34% N 0% P<sub>2</sub>O<sub>5</sub> 0% K<sub>2</sub>O

$$\begin{array}{l} 1 \text{ pound N} \\ \text{Per 1,000 ft}^2 \end{array} \times \frac{100 \text{ pounds 34-0-0}}{34 \text{ pounds of N}} = \begin{array}{l} 3 \text{ Pounds of 34-0-0} \\ \text{Per 1,000 ft}^2 \end{array}$$

# Pretend our P and K are low...

Lawn need is,  
1 pound of N, P<sub>2</sub>O<sub>5</sub>, and K<sub>2</sub>O  
per 1,000 ft<sup>2</sup>

And fertilizer we have is,  
10% N      10% P<sub>2</sub>O<sub>5</sub>      10% K<sub>2</sub>O

$$\begin{array}{l} \text{1 pound N} \\ \text{Per 1,000 ft}^2 \end{array} \times \frac{\text{100 pounds 10-10-10}}{\text{10 pounds of N}} = \begin{array}{l} \text{10 Pounds of 10-10-10} \\ \text{Per 1,000 ft}^2 \end{array}$$

This also applies 1 pound of P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O

## Doing the math...

We applied 10 pounds of 10-10-10

$$\begin{array}{l} 10 \text{ pounds product} \\ \text{per } 1,000 \text{ ft}^2 \end{array} \times \frac{10 \text{ pounds P}_{205}}{100 \text{ pounds of } 10-10-10} = \begin{array}{l} 1 \text{ pound P}_{205} \\ \text{per } 1,000 \text{ ft}^2 \end{array}$$

$$\begin{array}{l} 10 \text{ pounds product} \\ \text{per } 1,000 \text{ ft}^2 \end{array} \times \frac{10 \text{ pounds K}_2\text{O}}{100 \text{ pounds of } 10-10-10} = \begin{array}{l} 1 \text{ pound K}_2\text{O} \\ \text{per } 1,000 \text{ ft}^2 \end{array}$$

# Pretend our K is low, but P is fine...

Lawn need is,

1 pound of N, and 1 pound of K<sub>2</sub>O  
per 1,000 ft<sup>2</sup>

And fertilizers we have are:

10% N	0% P <sub>2</sub> O <sub>5</sub>	0% K <sub>2</sub> O
0% N	0% P <sub>2</sub> O <sub>5</sub>	50% K <sub>2</sub> O

$$\begin{array}{l} \text{1 pound N} \\ \text{Per 1,000 ft}^2 \end{array} \times \frac{100 \text{ pounds 10-0-0}}{10 \text{ pounds of N}} = \begin{array}{l} 10 \text{ Pounds of 10-0-0} \\ \text{Per 1,000 ft}^2 \end{array}$$

$$\begin{array}{l} \text{1 pound K}_2\text{O} \\ \text{Per 1,000 ft}^2 \end{array} \times \frac{100 \text{ pounds 0-0-50}}{50 \text{ pounds of K}_2\text{O}} = \begin{array}{l} 2 \text{ Pounds of 0-0-50} \\ \text{Per 1,000 ft}^2 \end{array}$$

# Which one is better?

Higher concentration fertilizer

Lower concentration fertilizer

*What is the cost per pound of nutrient?*

*What is the release rate?*

*What is the plant's need?*

# Liquid fertilizers

# Additional Liquid fertilizer question to ask yourself...

What is its density?

# Liquid fertilizers

Now have to worry about converting gallons to pounds...

May be on front or back of bottle

$26.2 \text{ pounds} / 2.5 \text{ Gallons} = 10.48 \text{ pounds per gallon}$

May have to look on Safety Data Sheet (SDS) for density

SECTION 9 – PHYSICAL AND CHEMICAL PROPERTIES		
Physical State:	Liquid	Odor and Appearance: No offensive odor. Dark brown to black color.
Specific Gravity:	1.165	Vapor Density (air = 1): N/A
Evaporation Rate:		Boiling Point (°C) > 212° F
pH:	5.5 +/- 0.5	Coefficient of Water/Oil Distribution:

Specific gravity of 1 = density of water = 8.354 pounds per gallon

# The liquid fertilizer formula

$$\begin{array}{l} \text{Recommendation} \\ \text{Pounds nutrient} \\ \text{per area} \end{array} \times \frac{\begin{array}{l} \text{From \% nutrient in the bottle} \\ 100 \text{ pounds product} \\ \hline \text{pounds nutrient} \end{array}}{\text{pounds nutrient}} = \begin{array}{l} \text{Pounds to apply} \\ \text{Pounds product} \\ \text{per area} \end{array}$$

$$\begin{array}{l} \text{Pounds to apply} \\ \text{pounds product} \\ \text{per area} \end{array} \times \begin{array}{l} \text{Density} \\ \text{Gallons} \\ \text{Per pound} \end{array} = \begin{array}{l} \text{Answer} \\ \text{Gallons to apply} \\ \text{Per area} \end{array}$$

# Liquid fertilizer, *doing the math...*

UAN

32% N      0% P<sub>2</sub>O<sub>5</sub>      0% K<sub>2</sub>O

$$\begin{array}{l} \text{Recommendation} \\ 1 \text{ pound N} \\ \text{Per 1,000 Sq. Ft.} \end{array} \times \frac{\begin{array}{l} \text{\#nutrient per 100\# product} \\ 100 \text{ pounds product} \\ 32 \text{ pounds N} \end{array}}{32 \text{ pounds N}} = \begin{array}{l} \text{Pounds to apply} \\ 3.13 \text{ pounds product} \\ \text{Per 1,000 Sq. Ft.} \end{array}$$

$$\begin{array}{l} \text{Pounds to apply} \\ 3.13 \text{ pounds} \\ \text{Per 1,000 Sq. Ft.} \end{array} \times \frac{\begin{array}{l} \text{Density} \\ 1 \text{ gallon} \\ 11 \text{ lbs. product} \end{array}}{11 \text{ lbs. product}} = \begin{array}{l} \text{Answer} \\ 0.28 \text{ Gallons product} \\ \text{Per 1,000 Sq. Ft.} \end{array}$$

# Checking a real life's bottle suggestion....

10% N    10% P<sub>2</sub>O<sub>5</sub>    10% K<sub>2</sub>O

**Bottle suggestion**  
Suggests 0.17 gal  
per 1,000 sq. ft.

$$\times \frac{\text{Density}}{10.5 \text{ pounds per gallon}} =$$

**Pounds product**  
1.8 pounds product  
per 1,000 sq. ft.

**Pounds to apply**  
1.8 pounds  
per 1,000 sq. ft.

$$\times \frac{\text{\#nutrient per 100\# product}}{10 \text{ lbs. N}} =$$

**Answer**  
0.18 pounds N  
per 1,000 sq. ft.

\$74.99 for 2.5 gallons

per 1,000 ft<sup>2</sup>

Do iterations of different products available to you to find the cost per area

# What is better?

Calcitic

Dolomitic

Both *start* reacting with soil as water is available

Less soluble

Has magnesium

Price depends on how close you are to a source

# What is better?

Ground lime

Pelletized “Pell” Lime

Check RNV

Check price

If pell is much more expensive than ground,  
Ask yourself, do you want to pay the convenience fee  
(*more even spread, less dust*)

# Liquid Lime

# Liquid lime math formula

Recommendation

Converts RNV for you

Pounds to apply

$$\begin{array}{l} \text{Pounds of lime as X\% RNV} \\ \text{per area} \end{array} \times \frac{\text{\%RNV on recommendation}}{\text{\% RNV you will buy}} = \begin{array}{l} \text{pounds products RNV} \\ \text{per area} \end{array}$$

Pounds to apply

Density

Gallons to apply

$$\begin{array}{l} \text{pounds products RNV} \\ \text{per area} \end{array} \times \begin{array}{l} \text{Gallons} \\ \text{per pound} \end{array} = \begin{array}{l} \text{Gallons} \\ \text{per area} \end{array}$$

Do iterations of different products available to you to find the cost per area

# One real life on the shelf product

Has an RNV of 70

A density of 14.8 pounds per gallon

Costs \$20 per gallon

Suggests 5 gallons per acre

# Liquid lime math formula

## Recommendation

100 Pounds as 65% RNV  
per 1,000 ft<sup>2</sup>

## Converts RNV for you

$$\times \frac{65}{70} =$$

*Product is 70% RNV*

## Pounds to apply

92 pounds  
per 1,000 ft<sup>2</sup>

## Pounds to apply

92 pounds  
per 1,000 ft<sup>2</sup>

## Density

$$\times \frac{1 \text{ Gallon}}{14.8 \text{ pounds}} =$$

## Gallons to apply

6.2 Gallons  
per 1,000 ft<sup>2</sup>

6.2 Gallons at \$20 per gallon is \$124 per 1,000 ft<sup>2</sup>

Remember the bottle's suggestion was 5 gallons per acre  
but we really needed 6.2 Gallons per 1,000 ft<sup>2</sup>

1 acre inch of water is about 27,000 gallons  
1,000 ft<sup>2</sup> x 1 inch of water is about 620 gallons

# Liquid Lime math

## Product details ^

Lime has been used for hundreds of years to “sweeten” or alkalize acidic soils. But nobody likes the drudgery of hauling heavy bags to a spreader, then applying it in a cloud of dust. Say goodbye to all that. With your [REDACTED] all you need to do is spray it, just like all our other liquid products. *Liming has never been easier!* You can also use [REDACTED] as a foliar spray to supply calcium for lawns, gardens, farms, and pastures! *Note: item may be labeled “Liquid Calcium” due to state labeling*

*laws.*

\$44.99

Size: gallon

Always ask, does the math add up?

Robert Florence  
RobertF@utk.edu

# Compost example

If we need  
1 lbs. of N per 1,000 ft<sup>2</sup>

And we have urban compost

~2 - ~0.25 - ~1.5

*UC Davis*

$$\begin{array}{l} \text{1 pound N} \\ \text{Per 1,000 ft}^2 \end{array} \times \frac{\text{100 pounds compost}}{\text{2 pounds N}} = \text{50 pounds dry compost} \\ \text{per 1,000 ft}^2$$

*If 10% of the N is available, then one would need 500 pounds*

*Umass Extension*

# Compost is good for...

Organic matter

Infiltration

Aeration

Retaining nutrients

Alleviating compaction
